ABSTRACT

Tagged smolts of sea trout were released into the headwater and below the dam at the town of Włocławek, lower Vistula River, in 1972 through 1974.

Returns from both sites of releases were similar and did not differ much from the returns of smolt released into the lower Vistula in other experiments. Fish were recaptured in the Vistula mouth, in the Bay of Gdańsk and in the Baltic. It is inferred that the dam does not endanger downstream migration of sea trout smolts.
